Idea for Senior Project

A JavaScript game/app using phaser.io in which it will use a database to store high scores and leaderboard information. Not too sure what the game will be on but have some ideas such as like minimalistic and simple shape games that challenge users to compete for highest scores, not for completing levels. I would be very interested in this because I would be able to make this game into an app or even just an online game in which friends can go on and compete. I will also want to eventually be able to package this game into a mobile app and put it on the App Store and Google Play Store!
